Natural Salt

Himalaya Crystal Salt was formed 250 million years ago in the life-giving ocean. Due to the geological activity, the ocean areas have dried out and the salt has been deposited in veins that have been lifted high up through the formation of the mountain range. Salt from the Himalayas contains 84 different minerals, which are all part of the human organism, and the Himalaya Crystal Salt's special feature is that the minerals are bound to the salt crystals. In other types of mineral containing salt the salt crystals and the minerals appear separated from one another. In the Himalaya Crystal Salt all the inherent minerals and trace elements are available in colloidal form, which also guarantees that the body is able to absorb them.

About salt

Salt is not just salt. Our common cooking salt is pure sodium chloride. The salt has been refined and thus cleaned for minerals and trace elements. The pure sodium chloride is useful in industrial processes and preservation. In the industrial processing minerals and trace elements are considered as pollution. Cooking salt intended for humans is added iodine and sometimes fluoride. Iodine is added to prevent iodine deficiency, which can cause struma and fluoride is added to strengthen teeth. To keep the salt easily flowing an anti-lumping agent is added, which normally contains either magnesium or aluminium. Natural salt will always be a product of dried up ocean water. This kind of salt will always contain a complex of minerals and trace elements as a natural part. Thus, natural salt is not just sodium chloride but also all the minerals and trace elements. Sea salt, rock salt and Himalaya Crystal Salt are all natural salts.

Usage

Himalaya Crystal Salt can be used for a variety of purposes. It can be used as a cooking salt instead of ordinary kitchen salt or also as a mineral supplement. Further, Himalaya Crystal Salt can be used for cleansing treatments, baths, skin oil, inhalation therapies and much more.

When used as a mineral supplement, drink ½ a teaspoonful of Himalaya Crystal Salt dissolved in a large glass of water in the morning (use the fine Himalayan Crystal Salt) or take a teaspoonful of a saturated solution in a glass of water.

How to make a saturated solution:

Put the Himalaya Salt crystals in a glass with a lid and fill the glass with water. After an hour, parts of the crystals are dissolved and the water cannot absorb more salt, the solution is saturated. It is important that there always are crystals in the water to make sure that the solution remains saturated. A saturated solution contains 26% salt. The water in the glass can be refilled when necessary and a saturated solution can keep almost for ever if it is not polluted.

Himalaya Crystal Salt is available in 2 qualities:

- Whole Crystals (1 kg)
- Fine grain (250 g)
- Fine grain (1 kg)
