

Reference: Agriculture and Gardening

Crops: Orchids

Country: Denmark

Contact person: Jess Romme, Margrethevej 10, 4690 Haslev, Tel: +45 56312689

Purpose of the treatment: To treat the orchids against attacks from fungus. Fungus attacks are a regular problem for orchid breeders.

Dosage: 15 ml Terra Biossa mixed with 5-10 litres of rainwater. During the summer are the orchids treated every week or every second week, depending on the whether (in warm periods every week). In the wintertime the orchids are treated every month.

Results: Terra Biossa seemed to have a strong effect on the orchids, not only on the fungus, but also on growth and the production of flowers. Problems with fungus are completely eliminated when Terra Biossa is used. The orchids are experiencing a faster growth and each plant bears more flowers.
